Lab x

Objective: In this lab we used an XXX sensor to measure YYY. We needed program the Arduino to calibrate and then access the sensor. Data was stored and displayed.

Material: Arduino Uno, sensor XXX, three 220-ohm resistors, EEPROM memory chip, breadboard and appropriate wires.

Schematic/picture of setup.

Program code, reference to code file, or link to code online.

Demonstration of lab working. Pictures of results, text files of output, videos of motion/change. Attach as links or as extra files to the submission.

Commentary: What went well. What was difficult? How did you attempt to overcome the difficulties? Questions on how this topic relates to other items?

References: Other information gathered, websites visited, books read.

Lab x+1

Objective: In this lab we used a DC motor to drive a wheel which …. We needed program the Arduino to control the speed and direction of rotation.

Material: Arduino Uno, sensor XXX, three 220-ohm resistors, EEPROM memory chip, breadboard and appropriate wires.

Schematic/picture of setup.

Program code, reference to code file, or link to code online.

Demonstration of lab working. Pictures of results, text files of output, videos of motion/change. Attach as links or as extra files to the submission.

Commentary: What went well. What was difficult? How did you attempt to overcome the difficulties? Questions on how this topic relates to other items?

Grading Rubric for labs.

- Complete all of the lab problems. (70%)
- Comment on what worked and what did not work as you worked through the lab. (10%)
- Show/discuss how you worked through problems. (10%)
- Comments on what you learned. (10%)
- Not looking for accurate answers, but wanting to see your process and thinking. Most learning occurs during failures.
